

SPIN-ON GEARBOX OIL FILTER

Improved design shows you when to change the element.

The new gearbox oil filter has better filtering capabilities and is easier to replace than the old-style filters. It mounts on the same bracket, uses the same plumbing*, and has these advanced features:

- Differential pressure indicator to inform the machine operator when to replace the filter element.
- New-style element filters down to 25 microns. The old screen-type elements filtered only down to 200 microns. Recirculating oil is cleaner, extending the life of the gearbox components.
- Spin-on canister is easier to replace. There are no loose gaskets to contend with and no casing to clean.

The easy-to-read differential pressure indicator makes maintenance simple. When the pressure indicator reaches the red zone, the filter is being bypassed and should be replaced.

This filter can be retrofitted to any 75 or 90 Model Extruder or Pug Sealer:

Part # PFB-D-1501-CB (75ADC only)
Part # PFB-D-1500-CB (all others)

The kit contains all necessary hardware plus detailed replacement instructions.

*Some plumbing modifications may be required
