

*A safer, easier way to maintain proper oil pressure.*

## One point for easy access and safe lubrication

The new Steele articulating oil manifold gives your machine operators a safer way to adjust oil pressure, moving the operator away from the front of the active die door.

This upgrade lets you control oil pressure to prevent friction and heat buildup in the die, without compromising worker safety or slowing production.

### Engineered for easier, faster maintenance

The articulating oil manifold uses the Steele color-coded hose system and quick couplings for easy identification of hoses and faster change-outs.

Preventive safety — it's not flashy, but it's effective. And safer is always better.

*Installed unit featuring Steele QR code, for instant online access to technical information.*
